## **DETAILED ACTION**

### ***Election/Restriction***

1. Restriction to one of the following inventions is required under 35 U.S.C. 121:
  - I. Claims 1-6 are drawn to a method for determining the presence of one or more analytes in a sample utilizing a reagent medium combined with the sample of interest wherein the reagents are added simultaneously, classified in class 435, subclass 7.1 for example.
  - II. Claims 7-18 are drawn to a method for determining the presence of one or more analytes in a sample utilizing a reagent medium combined with the sample of interest requiring reagent binding wherein the reagents are added at varying exposure times, classified in class 436, subclass 501 for example.
  - III. Claims 19-34 are drawn to a method and kit for determining the presence of one or more analytes (drug screen) in a sample utilizing a reagent medium combined with the sample of interest measuring interaction in close proximity (does not require reagent binding) wherein the reagents are added at varying exposure times, classified in class 435, subclass 7.92 and class 422, subclass 61.
2. The inventions are distinct, each from the other because of the following reasons:

Inventions I, II, and III are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01).

Art Unit: 1641

In the instant case, each of the different method inventions of Groups I, II, and III are distinct because they have different modes of operation which represent independent and different method steps (having separate searchable limitations). Group I merely measures analytes in a combined reaction mixture evaluating signal alterations, Group II requires separate reagent addition steps and reagent binding to evaluate signal alterations, while Group III requires separate reagent addition steps, antibody/drug interactions, particle binding, and does not require sample binding (close proximity interaction) to evaluate signal alterations. Although the methods function to measure signal alterations, they each contain patentably different methods steps and reagents to that end.

3. Because these inventions are distinct for the reasons given above and have acquired separate status in the art as shown by their different classification, recognized divergent subject matter and because the search required for each invention is not substantially coextensive with the search required for the remaining invention, restriction for examination purposes as indicated is proper. Please note that the classifications in the restriction are illustrative only and do **not** represent all the classes and subclasses which must be searched for each invention; nor is the search limited to issued US patents, but rather includes published foreign patents and applications as well as literature search, which in this case would be divergent for each of the claimed inventions.

Art Unit: 1641

4. Applicant is advised that the reply to this requirement be complete and must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).

5. Applicant is reminded that upon cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a petition under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(I).

6. Papers related to this application may be submitted to Group 1600 by facsimile transmission. Papers should be faxed to Group 1600 via the PTO Fax Center located in Crystal Mall 1.
